Abstract

A seal arrangement for reducing the seal gaps within a rotary flow machine, preferably an axial turbomachine, blades and guide having rotor vanes, which respectively arranged in at least one rotor blade row and guide vane row and have respective blade/vane roots (2,3) which protrude into fastening contours within the rotor The invention blade and guide vane rows, is described. is characterized in that a sealing element (4)plastically deformable material is provided between at least two adjacent blade/vane roots (2,3) along a rotor blade row or guide vane row or between a blade/vane root (2,3) of a rotor blade or guide vane and a rotary flow machine component directly adjoining the blade/vane root.
